1. Executive Summary

This Business Requirement Document (BRD) defines the functional and non-functional requirements for the Resource Reservation System (RRS) for SLT Mobitel Nebula Institute of Technology.

The proposed system is a web-based centralized platform designed to manage, allocate, reserve, and monitor institutional resources efficiently. These resources include lecture halls, laboratories, auditoriums, meeting rooms, hostels, and equipment, which are currently managed using manual or semi-digital processes.

The absence of a centralized system has resulted in resource conflicts, double bookings, lack of accountability, poor utilization tracking, and administrative inefficiencies. RRS aims to eliminate these challenges by introducing automated scheduling, role-based access control, real-time availability tracking, approval workflows, and reporting mechanisms.

The system will significantly enhance operational efficiency, transparency, and optimal resource utilization, supporting both academic and administrative operations across multiple centers of the institute.

2. Project Objectives

The primary objective of the Resource Reservation System is to establish a centralized and automated reservation framework that eliminates manual scheduling inefficiencies.

The system seeks to achieve the following business goals:

- **Automation of Resource Scheduling**

The system will replace manual booking methods with a digital platform that validates reservations automatically, ensuring that double bookings and overlapping time slots are prevented.

- **Real-Time Resource Visibility**

Users will be able to view current availability of resources across centers in real time, allowing for better planning and coordination.

- **Real-Time Resource Utilization**

The system will provide real-time monitoring of resource utilization across all centers, enabling optimal usage tracking and data driven decision making.

- **Role-Based Access Control**

The system will automatically calculate lecture fees and other reservation related charges based on predefined rates, duration, resource type, and applicable conditions.

3. Project Scope

The RRS will include the following core modules:

- User & Role Management
- Resource Management
- Reservation Management
- Centre & Cohort Management
- Approval & Override Management
- Availability Calendar
- Reporting & Analytics
- System Administration

4. Solutions

The proposed solution is a web-based Resource Management & Reservation System built using a modular architecture.

Core Solution Components

- Centralized resource registry
- Smart reservation engine with conflict detection
- Role-based dashboards
- Approval workflows
- Calendar-based scheduling UI
- Audit logs and reports

5. User Roles

Stakeholder Role	Primary Responsibilities & System Interaction
Developer	Develops, maintains, tests, and deploys the system. Handles bug fixing, database management, integrations, backups, and system updates.
Super Admin	Top level of the user hierarchy with full system control including managing users, roles, permissions. Provides overview of the entire system including reservations, resources, their approvals, and payments of existing resources.
Admin	Approves or rejects reservations, handles daily operations.
Coordinator	Reserves reservations. Real time management of reservations and schedules.
Resource Owner	Approves reservations for their resources and monitors resource usage.
Nebula SMS Users	General system user who can log into the Resource Reservation System to view their personal schedules and reservations.
SLT Employees	Can reserve resources. Their details are displayed with particular reservations.
Management Role	Can access relevant information from the system related to their role for oversight and decision making purposes.
Canteen	Views daily expected customers, orders, and meal forecasts. Manages advance reservations for large group orders or events.

6. Current Process

6.1 Summary of Current Workflow

The organization currently relies on manual communication methods, spreadsheets, and informal reservation handling processes for managing institutional resources. This approach creates operational inefficiencies, increases the risk of scheduling conflicts, and reduces overall resource visibility and management accuracy.

- Resource Reservation: Employees and staff members request resources through emails, phone calls, or manual requests, making reservation tracking difficult.
- Resource Availability Management: Resource availability is checked manually by coordinators or resource owners, increasing the possibility of double bookings and scheduling conflicts.

- **User and Access Management:** User account creation, role assignment, and permission management are handled manually, causing delays and inconsistencies in access control.
- **Approval Process:** Reservation approvals require manual coordination between requesters, coordinators, and resource owners through calls, emails, or paper-based confirmations.
- **Reservation Monitoring:** Existing reservations and schedules are maintained using spreadsheets or separate records, making it difficult to monitor real-time resource utilization.
- **Reporting and Analytics:** Reservation reports, utilization summaries, and operational statistics are prepared manually, which is time-consuming and prone to errors.
- **Communication and Notifications:** Reservation confirmations, cancellations, and approval updates are communicated informally through emails or phone calls without centralized tracking.
- **Payment Handling:** Payments related to special resource reservations are managed manually, creating difficulties in tracking transactions and maintaining payment records.

6.2 Problems in Existing Workflow

- No centralized reservation system.
- High risk of double bookings and scheduling conflicts.
- Difficulty tracking real-time availability.
- Manual approval process causes delays.
- Lack of transparency and accountability.
- Resource utilization reports are unavailable.
- Limited audit tracking for reservations and approvals.
- Inefficient communication among departments.

7. Proposed Solution

7.1 Diagrams

7.1.1 System Overview Flow Diagram

7.1.2 Dashboard Workflow

7.1.3 User Management Workflow

7.1.4 Resource Management Workflow

7.1.5 Reservation Management Workflow

7.1.6 Approvals Management Workflow

7.2 User Interface Requirements

7.2.1 Login page

The Login Page allows authorized users to access the system using their username and password. Users are authenticated based on their assigned role, and upon successful login they are redirected to their respective dashboards. Invalid login attempts display an error message.

7.2.2 Dashboard

Role	Dashboard Requirements
Super Admin	The Super Admin Dashboard provides a centralized view for monitoring the entire Resource Management System. It includes total reservations, active users, payment summaries, system notifications, and overall analytics across all organizational locations.
Admin	The Admin Dashboard supports operational management by displaying daily reservations, available resources, pending approvals, maintenance alerts, payment records, and recent system activities. It enables administrators to approve/reject reservations efficiently.
Coordinator	The Coordinator Dashboard allows coordinators to monitor reservation requests, reservation status, upcoming bookings, resource schedules. It supports reservation creation and real-time schedule management.
Resource Owner	The Resource Owner Dashboard provides visibility into assigned resources, pending reservation approvals, approved and rejected requests, maintenance schedules. It helps resource owners manage resources and monitor usage effectively.
SLT Employees	The SLT Employees Dashboard allows users to view available resources, create reservations, track their personal reservation status. Their details are displayed with relevant reservations.
Management	The Management Dashboard provides access to relevant information and reports related to their role for oversight and decision-making purposes, including resource utilization.
Nebula SMS Users	The User Dashboard allows users to view their personal reservation history, reservation status, notifications, and upcoming reservation schedules. It provides a view-only self-service interface.
Developer	The Developer Dashboard provides technical monitoring capabilities including system health, application logs, API and service status, backup monitoring, error reports, and deployment activities. It supports system maintenance and troubleshooting operations.

Resource Reservation System (NRRS) All Rights Reserved.

7.2.3 Create User

The Create User function allows authorized users to register new users in the system by entering user information and assigning appropriate roles and permissions. User details such as name, NIC (username), email address, contact number, designation and role can be entered during the registration process. The system validates all required information before creating the user account and prevents duplicate user registrations. Once created, the user receives access privileges based on the assigned role. This functionality ensures secure, controlled, and role-based access to the Resource Reservation System.

The screenshot displays the 'User Registration' form within the Nebula NRRS interface. The form is set against a cosmic background and includes a sidebar with navigation options: Dashboard, Manage Users (selected), Reservations, Calendar, Resources, Analytics, and Settings. At the bottom of the sidebar are links for Support and Sign Out. The registration form itself contains the following fields and options:

- Full Name:** Text input with placeholder 'e.g. John Doe'.
- Service Id:** Text input with placeholder 'SID-XXXX'.
- NIC (National Identity Card):** Text input with placeholder 'XXXXXXXX'.
- Note:** A blue italicized note states 'NIC is used as the user name'.
- Email Address:** Text input with placeholder 'user@nebula.edu'.
- Location:** A dropdown menu currently showing 'Colombo Main Campus'.
- Password:** A text input with masked characters '.....' and a toggle icon to show/hide the password.
- Designation:** A dropdown menu currently showing 'Admin'.
- User Type:** A dropdown menu currently showing 'Internal'.

A prominent blue 'Create User' button is located at the bottom of the form. The footer of the page includes the copyright notice: '© 2026 SLT Mobitel Nebula Institute of Technology' and 'Resource Reservation System (NRRS) All Rights Reserved.'

7.2.4 User Management

The User Management page allows authorized users to manage all user accounts within the system. Administrators can create new user accounts, update existing user information, reset passwords, activate or deactivate accounts, and remove users when required. The module also supports role and permission management to ensure that users have appropriate access rights based on their responsibilities. User activities can be monitored through audit logs, improving system security, accountability, and administrative control.

User Management
Control access, roles, and profiles for Nebula RRS users.

Summary Cards:

- Total Users:** 1,284 (+12% from last month)
- Active Users:** 1,150 (Active Now)
- Inactive Users:** 94 (-2% decrease)

Footer: © 2026 SLT Mobitel Nebula Institute of Technology
Resource Reservation System (NRRS) All Rights Reserved.

7.2.5 Create Resources

The Create Resources function allows authorized users to register and manage both Human Resources and Physical Resources within the system. Human Resources include Program Coordinators, Trainers, Lecturers, Assessors, and other personnel who can be assigned to reservations, meetings, training sessions, and events. Physical Resources include lecture halls, training rooms, laboratories, meeting rooms, auditoriums, projectors, computers, vehicles, and other equipment.

Users can define resource details including resource name, resource category, resource type, location, assigned resource owner, availability schedule, and status. For physical resources, additional information such as capacity, purchase date, warranty information, maintenance records, and maintenance schedules can also be maintained. The system validates all information before creating the resource record and stores it for future reservation, scheduling, maintenance, and reporting purposes.

7.2.6 Create Reservations

The Create Reservations function enables authorized users to reserve available resources by selecting the required resource, reservation date, time period, and purpose of use. The system automatically checks resource availability and prevents conflicting or duplicate reservations. Reservation requests are submitted for approval based on the configured approval workflow and resource ownership rules. Once approved, reservation records are automatically updated in the system and displayed in the reservation calendar. Users can also receive notifications regarding reservation status updates, approvals, rejections, or modifications.

7.2.7 Existing Resources

The Existing Resources page displays all registered Human Resources and Physical Resources available in the system. Authorized users can search, filter, view, update, and manage resource records according to their assigned permissions. Resources can be filtered by category, resource type, location, resource owner, availability status, and maintenance status.

The page provides detailed information about each resource including current availability, reservation schedules, utilization details, maintenance history, and ownership information. For Human Resources, users can view assigned activities and availability schedules. For Physical Resources, users can view maintenance records, reservation history, warranty details, and operational status. This functionality improves resource visibility, supports efficient resource utilization, and helps prevent scheduling conflicts through real-time resource monitoring.

Existing Resources
Monitor real-time availability, schedule maintenance cycles, and manage structural allocations.

7.2.9 Reservation Calendar

The Reservation Calendar provides a calendar based view of all resource bookings and schedules within the system. Users can easily identify available and reserved time slots in real time through daily, weekly, monthly, and agenda views. The calendar displays reservation details including resource name, reservation owner, reservation status, booking duration, and location.

Users can filter calendar entries by resource category, resource type, location, reservation owner, and reservation status. The system automatically highlights conflicting reservations and unavailable time slots to prevent double bookings. Authorized users can directly access reservation details from the calendar view and create new reservations based on available time slots.

The calendar also supports real-time updates, ensuring that newly approved, modified, or cancelled reservations are immediately reflected across the system. This functionality improves scheduling visibility, resource utilization, coordination between departments, and overall reservation management efficiency.

7.2.10 Approvals

The Approvals module allows authorized users to review reservation requests submitted by system users before resources are allocated. And Super Admin handles high level overrides and special requests. Based on resource availability, organizational policies, scheduling priorities, and approval authority levels, approvers can approve, reject, or request modifications to reservation requests.

The module displays all pending approval requests together with relevant reservation details including reservation ID, resource information, requester details, reservation date and time, purpose of reservation, and current status. Approvers can review the request and provide comments or reasons when approving, rejecting, or requesting changes.

The system automatically notifies users regarding approval decisions through system notifications and email alerts where applicable. Approved reservations are automatically recorded and reflected in the Reservation Calendar, while rejected or modified requests are returned to the requester with the relevant comments for further action.

The module maintains a complete approval history and audit trail, including approval dates, approver information, comments, and status changes. Users with appropriate permissions can search, filter, and monitor approval records based on reservation status, resource category, date range, resource owner, and requester. This functionality ensures transparency, accountability, and efficient management of the reservation approval process.

7.2.11 Hostel Reservation

The Hostel Reservations enables centralized booking and management of hostel accommodations. Authorized users can create new hostel reservations by entering essential details such as Reservation ID, Guest Name, Room Category, Check-In date, and Check-Out date. The system automatically validates availability based on room category and dates to prevent overlaps or double bookings. Once submitted, reservations enter an approval workflow where designated approvers can review, accept, or reject them.

Hostel Reservations
Manage student and guest accommodation logistics across the Nebula campus.

Summary Cards:

- TOTAL BOOKINGS: 1,284 (+4.2% ↑)
- CHECK-INS TODAY: 42 Expected
- AVAILABLE ROOMS: 18 Low Vacancy
- PENDING REQUESTS: 27 Action Required

Filters:

- CHECK-IN DATE RANGE: mm/dd/yyyy
- ROOM CATEGORY: All Categories

7.2.12 Canteen Management

The Canteen Management provides a view only dashboard for canteen staff to forecast and manage daily operations. It displays expected number of customers, confirmed meal reservations, and order volumes for each day, enabling better preparation of meals, staffing, and inventory.

Additionally, the system supports advance reservations for large group orders or events. Coordinators or authorized users can submit canteen reservations specifying date, time, meal type, number of orders, and special requirements. These reservations help the canteen anticipate and efficiently handle bulk demands while integrating with overall resource scheduling. The dashboard focuses on daily forecasts to optimize canteen operations.

7.2.13 Payment

The Payments process handles two types of financial transactions within the Resource Reservation System.

Lecture Fee Payments: The system automatically calculates lecture fees and salaries for academic staff based on predefined rates, hours delivered, qualifications and applicable conditions. This replaces the existing manual calculation process with accurate, automated computation and generates payment summaries and reports for finance and administration.

Resource Reservation Payments: Users (or coordinators on their behalf) can complete payments for paid resources during or after the reservation process. The system calculates the applicable fee based on resource type, duration, add-ons, and other factors, then processes the payment. Payment status is tracked against each reservation, with receipts generated upon successful transaction. This ensures proper revenue collection and financial transparency for resource usage.

Lecture Fee Payment
Monthly settlement and payout management for academic staff.

Time Range: Current Month (Oct 2024) | Department: All Departments | [Export Fee Report](#)

LECTURER NAME	DEPARTMENT	USER TYPE	HOURS	HOURLY RATE	TOTAL FEE
Dr. Julianne Smith PhD in Computer Science	Comp Science	Internal	120	\$ 75.00	\$9,000.00
Marcus Richardson MSc in Engineering	Engineering	External	85	\$ 60.00	\$5,100.00
Elena Lombardi MBA in Finance	Business	Visiting	64	\$ 95.00	\$6,080.00
Alan Turing Jr. PhD in Mathematics	Comp Science	Internal	200	\$ 110.00	\$22,000.00

8. Functional Requirements

8.1 Dashboard Functions

Use Case ID	NRRS-D01
Function Name	View Dashboard & Home Page
Actors	Super Admin, Admin, Coordinator, Resource Owner, Nebula SMS Users , SLT Employees
Description	Allows authorized users to access a role-based dashboard displaying reservation summaries, approvals and notification.
Pre-conditions	User must be authenticated successfully.
Post-conditions	Relevant dashboard information is displayed according to user role permissions.
Inputs	User credentials, dashboard filters
Outputs	Dashboard widgets, alerts, reservation summaries
Notification / Message / Alerts	“Login successful”, pending approval notifications
Success Path	User Action: User logs into NRRS System Response: System retrieves and displays dashboard data and alerts
Special Points	Dashboard contents dynamically change according to assigned user roles.

8.2 User Management Functions

Use Case ID	NRRS-U01
Function Name	Create/Update User Account
Actors	Coordinator, Developer/Admin
Description	Administrators can create, update, or deactivate user accounts and assign roles/permissions for secure access.
Pre-conditions	Admin logged into NRRS
Post-conditions	User account created/updated/deactivated with correct permissions
Inputs	Name, Email, Role, Password
Outputs	Success/failure confirmation
Notification / Message / Alerts	“User account created successfully!” “User account updated successfully!”
Success Path	User Action: Admin enters user details System Response: System validates inputs, saves data, and confirms success
Special Points	Role-based access is strictly enforced; password policies apply

Use Case ID	NRRS-U02
Function Name	Reset User Password
Actors	Coordinator, Developer/Admin
Description	Allows secure password reset for any user
Pre-conditions	User exists in the system
Post-conditions	User receives new password/reset link
Inputs	User email or username
Outputs	Temporary password or reset link
Notification / Message / Alerts	“Password reset successfully!” “Invalid user email”
Success Path	User Action: Admin requests password reset System Response: System validates user, generates a temporary password, and notifies user
Special Points	Temporary password must expire within a set time frame

8.3 Create Reservation Functions

Use Case ID	NRRS-CR01
Function Name	Create Reservation
Actors	Resource Owner, Coordinator
Description	Allows authorized users to create a reservation request by selecting an available resource, date, time, and reservation purpose
Pre-conditions	User must be logged into the system. Resource must be available for the selected date and time
Post-conditions	Reservation request is successfully created and submitted for approval
Inputs	Resource Selection, Reservation Date, Start Time, End Time, Purpose of Reservation
Outputs	Reservation Record, Reservation ID, Reservation Status (Pending Approval)
Notification / Message / Alerts	"Reservation submitted successfully and sent for approval."
Success Path	User Action: User selects a resource, enters reservation details, and submits the request System Response: System validates resource availability, records the reservation request, assigns a reservation ID, and displays a confirmation message
Special Points	The system automatically checks resource availability in real time and prevents duplicate bookings

Use Case ID	NRRS-CR02
Function Name	Cancel Reservation
Actors	Resource Owner, Coordinator, Admin
Description	Allows users to cancel an existing reservation before the scheduled reservation period.
Pre-conditions	Reservation must exist and be eligible for cancellation according to system policies.
Post-conditions	Reservation status is updated to "Cancelled" and the resource becomes available for new reservations.
Inputs	Reservation ID, Cancellation Reason
Outputs	Updated reservation record

Notification / Message / Alerts	"Reservation cancelled successfully"
Success Path	User Action: User selects an existing reservation and clicks the Cancel option. System Response: System validates cancellation eligibility, updates the reservation status, releases the resource, and confirms successful cancellation.
Special Points	• System should prevent cancellation of completed reservations. • Cancellation reason may be mandatory based on organizational policies. • Notifications may be sent to relevant stakeholders regarding the cancellation.

8.4 Existing Reservation Functions

Use Case ID	NRRS-ER01
Function Name	Existing Reservations
Actors	Admin, Coordinator
Description	Displays all existing reservations and their statuses.
Pre-conditions	Reservations must exist in the system.
Post-conditions	Reservation details are displayed successfully.
Inputs	Search filters, reservation ID
Outputs	Reservation list
Notification / Message / Alerts	“No reservations found”
Success Path	User Action: Admin enters module/course details System Response: System validates and saves data
Special Points	

8.5 Reservation Calendar Functions

Use Case ID	NRRS-RC01
Function Name	Reservation Calendar
Actors	All Authorized Users
Description	Displays resource bookings and schedules in calendar view.
Pre-conditions	Reservation data must exist.
Post-conditions	Calendar view is displayed successfully.
Inputs	Date range, resource filters
Outputs	Reservation calendar
Notification / Message / Alerts	“Selected slot unavailable”
Success Path	User Action: Finance officer inputs payment info System Response: System calculates totals, validates, and updates records
Special Points	Real-time updates should be supported.

8.6 Create Resources Functions

Use Case ID	NRRS-CR01
Function Name	Create Resources
Actors	Admin, Resource Owner
Description	Allows authorized users to add new resources into the system.
Pre-conditions	User must have resource management permission.
Post-conditions	Resource is added successfully.
Inputs	Resource name, category, location, capacity
Outputs	Resource record
Notification / Message / Alerts	“Resource created successfully”
Success Path	User Action: Admin approves/denies clearance System Response: System updates clearance status

Special Points	Resource categories and availability must be maintained.
-----------------------	--

8.7 Existing Resources Functions

Use Case ID	NRRS-ER01
Function Name	Existing Resources
Actors	Admin, Resource Owner
Description	Displays all registered resources within the system.
Pre-conditions	Resources must exist in the database.
Post-conditions	Resource details are displayed successfully.
Inputs	Search criteria, resource filters
Outputs	Resource list
Notification / Message / Alerts	“No resources available”
Success Path	User Action: Admin submits special approval System Response: System validates and records approval
Special Points	Search and filtering should be enabled.

8.8 Approvals Function

Use Case ID	NRRS-A01
Function Name	Approvals
Actors	Super Admin, Admin
Description	Allows authorized users to approve or reject reservation requests.
Pre-conditions	Pending reservations must exist.
Post-conditions	Reservation approval status is updated.
Inputs	Approval decision, comments
Outputs	Updated reservation status
Notification / Message / Alerts	“Reservation approved successfully”
Success Path	User Action: Select report and filters System Response: System generates and displays/export report
Special Points	Approval history should be maintained.

8.9 Payments Function

Use Case ID	NRRS-P01
Function Name	Payments
Actors	Requester, Finance Officer
Description	Handles payment processing related to resource reservations.
Pre-conditions	Reservation must be confirmed.
Post-conditions	Payment transaction is completed successfully.
Inputs	Payment details, reservation ID
Outputs	Payment receipt
Notification / Message / Alerts	“Payment completed successfully”
Success Path	User Action: IT staff performs maintenance System Response: System executes updates, backups, and logs activity
Special Points	Payment transactions should be secure and auditable.

9. Non-Functional

Requirements Security

- **Role-Based Access Control:** The system must strictly enforce user permissions based on predefined roles to ensure users can only access data and functionalities relevant to their responsibilities.
- **Secure Authentication:** All users must authenticate through a secure login mechanism using a unique User ID and password.
- **Data Encryption:** All data transmitted between the client browser and the server must be encrypted using SSL/TLS (HTTPS).
- **Network Protection:** The system will be protected by a combination of network firewalls and a Web Application Firewall (WAF) to defend against external threats.

Performance and Availability

- **High Availability:** The system must be deployed in a virtualized environment (VMware) with high availability (HA) enabled to ensure fault tolerance and minimize downtime.
- **Load Balancing:** A load balancer will be used to distribute traffic evenly across multiple application servers, ensuring optimal performance and preventing any single server from becoming a bottleneck.

Compatibility

- **Operating Systems:** The client-side application must be accessible on modern desktop operating systems, including Windows, macOS, and Linux.
- **Web Browsers:** The web-based application must be fully compatible with the latest versions of major web browsers, including Google Chrome, Mozilla Firefox, and Microsoft Edge.

Data Integrity

- **Input Validation:** The system must perform input validation on all data entry forms to prevent errors and ensure the accuracy and consistency of data entered into the system.

10. Resource Requirements

Resource Category	Specification
Operating System	Server: Linux (Ubuntu 22.04 / Rocky Linux 9) Client: Windows 10/11, Linux, macOS
Programming Languages & Frameworks	PHP – Backend (Framework: Laravel) HTML, CSS, JavaScript, Bootstrap – Frontend
Frontend Template	AdminLTE
Database	MySQL / MariaDB (Primary–Replica or Galera Cluster)
Web Server	Apache or Nginx
IDE / Development Tools	Visual Studio Code, PhpStorm, Composer, Git
Testing Tools	Selenium, Manual Test Cases
Web Browser	Google Chrome, Mozilla Firefox, Microsoft Edge

Documentation Tools	Microsoft Word, Figma, Lucidchart/Draw.io
Hardware	Web/App Servers: 2–4 vCPU, 4–8 GB RAM, 40–60 GB SSD Database Servers: 4–6 vCPU, 8–12 GB RAM, 100–200 GB SSD Load Balancer: 2 vCPU, 2–4 GB RAM Client Devices: Intel Core i3 or higher, 4 GB RAM, 250 GB HDD/SSD
Human Resources	Project Manager, System Analyst, Developers (Frontend & Backend), Database Administrator, QA/Test Engineers, Technical Support Staff, End Users (Administrators, Lecturers, Students)
Network & Security	High-speed LAN/WAN, VMware HA Virtualization, Network Segmentation (DB internal VLAN, Web/App DMZ VLAN), Firewall + WAF (VMware NSX, ModSecurity/Cloudflare), SSL/TLS Secure Login & Authentication

11. Appendices

11.1 Glossary of Terms

Term/Acronym	Definition
BRD	Business Requirement Document
RRS	Resource Reservation System
NIC	National Identity Card
UAT	User Acceptance Testing
WAF	Web Application Firewall
NSMS	Nebula Students Management System
PA-L1	Program Administrator Level 01
PA-L2	Program Administrator Level 02
SSL/TLS	Secure Sockets Layer / Transport Layer Security
HA	High Availability
HTTPS	HyperText Transfer Protocol Secure
VMware	Virtual Machine Software (virtualization platform)
RBAC	Role-Based Access Control
SSCL	Social Security Contribution Levy
KPI	Key Performance Indicator
CSV	Comma-Separated Values
PDF	Portable Document Format
IT	Information Technology
DMZ	Demilitarized Zone
VLAN	Virtual Local Area Network
NSX	Network and Security Virtualization (VMware Product)
IDE	Integrated Development Environment
QA	Quality Assurance
